1. Change History

Date	Comment
2024.11.05	Initial version
2025.06.04	New error scenarios

2. General Setup Environment

a) Operating System:
    - Windows 10, or higher
    - Apple macOS 10.15 or higher

b) Get an installation of Eclipse (usually the latest), e.g. Eclipse IDE for Java Developers

c) Get the latest ADT version installed (https://tools.hana.ondemand.com/latest)

d) for guidance on downloading the Eclipse IDE and ADT plugin, please refer to the following tutorial: https://developers.sap.com/tutorials/abap-install-adt.html

3. Issue List

Error message 1: ***"You were successfully authenticated, but an error occurred during the Service Instance logon. Please ensure that you have a user for the Service Instance."***

Problem cause: Typically, this is caused by a persona mismatch. (e.g. browser logon was performed with a different non-developer user)

Solution:

Use a new fresh browser session:

- Start the creation of a new ABAP cloud project in ADT
- Follow the instructions until you get to the wizard page "Logon to the SAP Cloud System", then click the button "Copy Logon URL to Clipboard"
- Open a new incognito window in your browser and manually enter the copied URL into the address line of that new browser window
- It is necessary that a logon page appears in the browser

If you work on company premises or internal network, you can try with another public network and personal devices. This is especially relevant if you are the owner of multiple users. In that case you need to ensure that you use the developer-user in the ADT-triggered browser logon, not the other. If you have been logged on in your main browser session as other user before, then the browser will probably reuse the existing logon-session of that.

Therefore, using a fresh browser session (e.g. a new incognito browser-session or using a completely different browser) can help to get a fresh logon where you can then explicitly use your developer-user.

Error message 2: ***"You were successfully authenticated, but an error occurred during the Service Instance logon."***

Problem cause: this is caused by a very old ADT version.

Solution: Please install the latest ADT.

1. In Eclipse, choose in the menu bar Help > Install New Software...
2. Enter the URL https://tools.hana.ondemand.com/latest
3. Press Enter to display the available features.
4. Select ABAP Development Tools and choose Next.
5. On the next wizard page, you get an overview of the features to be installed. Choose Next.
6. Confirm the license agreements and choose Finish to start the installation.

Error message 3: ***"Cannot connect to Service Instance. The service is currently not available."***

Problem cause: this is caused by an outdated ADT version.

Solution: Update your ADT into the latest version, please refer to the steps above.

Error message 4: ***"You were successfully authenticated, but an error occurred during fetching the Service Instance's SAP System ID."***

Problem cause: this is caused by an outdated ADT version.

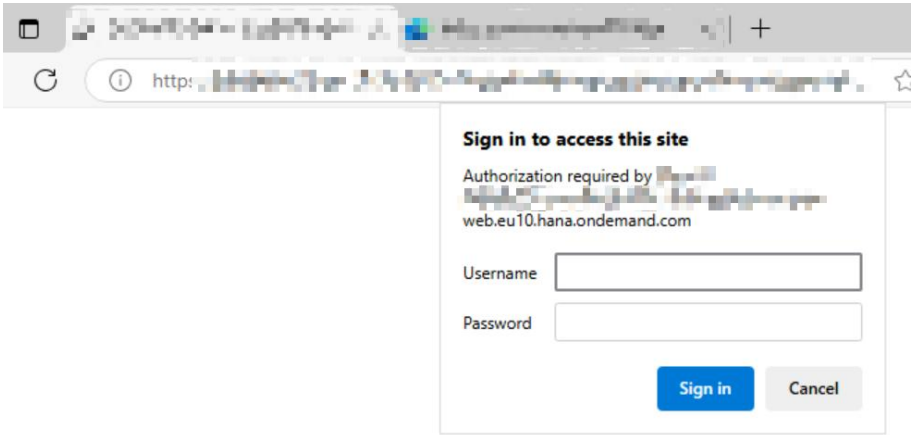
Solution: Update your ADT into the latest version, please refer to the steps above.

Error message 5:" An error occurred during JWT validation. The JWT is expired. Therefore, please check your local system clock"

Problem cause: Your PC's system clock has a deviation from the time server.

Solution: Adjust your local system clock to match the accurate time provided by the time server.

Error message 6: Upon successfully authenticating your user and password, a secondary popup appears prompting for additional credentials. See image for reference.



Problem cause: This issue typically arises from a user assignment problem.

Solution: First, verify your enrollment status. If you are shown as enrolled, try to remove your enrollment and wait a few minutes. Then, refresh the system access page and re-enroll. This process will re-trigger your user assignment. Once re-enrollment is complete, proceed with the login steps using a clean browser (with cleared cache and cookies) or a new incognito window. This should resolve the issue. If the problem persists, please seek assistance through our support channels as outlined in the system setup guide.

4. ADT version

We fully suggest learners to install the latest ADT version, an up-to-date version always has better function and learning experience, also improves on the error message with more details provided, if the error persists during your logon, detailed error message would be helpful. Accordingly, a suitable Eclipse version is necessary

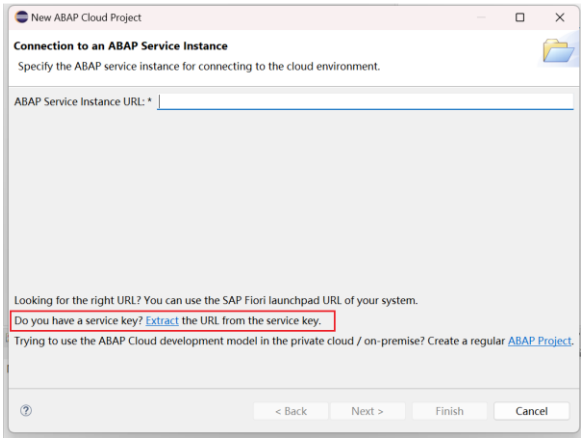
5. Reference link:

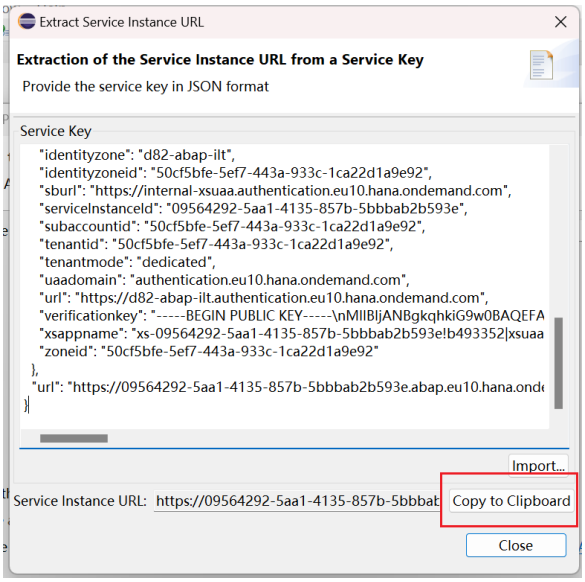
Download the Eclipse IDE and add the ABAP Development Tools (ADT) Plugin | SAP Tutorials

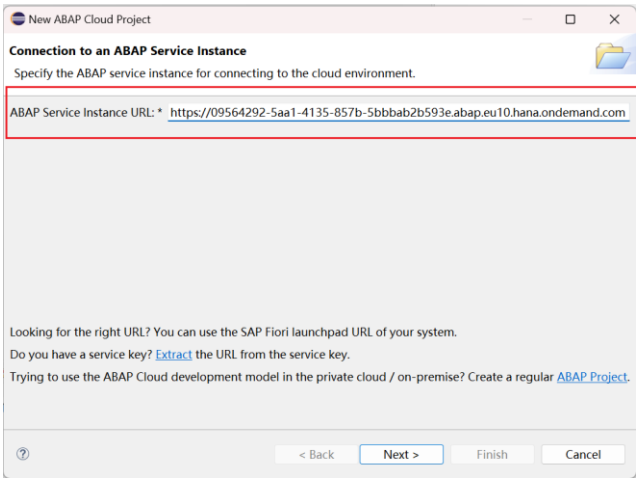
https://education.hana.ondemand.com/education/pub/mmcp/index.html?library=library.txt&show=project!PR_CFA821567D1C62AF:demo#11 (Caution: this demo's service key logon part only applies to the

ADT version older than 3.46, and it shows you how to connect your Eclipse environment with the SAP BTP ABAP Instance, and more importantly, it shows you how to create your first ABAP Cloud Project.)

If you are working on ADT version higher than 3.46, you should extract the system url from the service key downloaded in the zip file and copy then paste the system url into the corresponding field, and click next to continue your logon.







New ABAP Cloud Project
Connection to an ABAP Service Instance
Specify the ABAP service instance for connecting to the cloud environment.
ABAP Service Instance URL: *
https://09564292-5aa1-4135-857b-5bbbab2b593e.abap.eu10.hana.ondemand.com
Looking for the right URL? You can use the SAP Fiori launchpad URL of your system.
Do you have a service key? Extract the URL from the service key.
Trying to use the ABAP Cloud development model in the private cloud / on-premise? Create a regular ABAP Project.
